

PRODUCT PAPER

Kipit Investment Platform - Mobile Application, Web Application,
WhatsApp Channel and Administration Console

Prepared by: Kipit Technologies Limited

Date: July 2026

Status: Final - for vendor engagement and quotation

Classification: Confidential - not for circulation beyond the engaged vendor

1. Purpose of this Document

This product paper defines the complete scope, functionality, business logic, and engagement terms for the design and development of the Kipit investment platform: a mobile application (Android and iOS), a web application, a WhatsApp channel, and a web-based administration console. It is the authoritative reference for the development vendor. The vendor is expected to quote, plan, and deliver against this document, and to raise any ambiguity in writing before development begins.

The document fixes **what** the platform must do and the principles it must follow. **How** screens look and feel (layout, typography execution, iconography, motion) is deliberately left to the vendor's UI/UX designers within the brand direction in Section 13, subject to the design approval gate in Section 15.

2. Business Context

Kipit Technologies Limited ("Kipit", "the Company") operates a digital investment platform in Nigeria. Kipit is the technology platform, distribution channel, and consumer brand. All client funds and investment products are managed by the Company's SEC-licensed asset management partner (the "Licensed Partner"). This dual structure has one critical consequence for the product: the app is Kipit-branded throughout, and the Licensed Partner appears in exactly one place in the interface - a short disclaimer at the bottom of the Invest tab (see Section 5.3).

Kipit is rebuilding its platform from scratch. An existing platform with fewer than 200 users exists; its user records, balances, and KYC data will be migrated into the new platform (Section 16). The new platform replaces the old one entirely.

Positioning: Kipit is Nigeria's regulated investment supermarket - one trusted app where individuals access safe, interest-yielding, institution-grade investment products, from a liquid call account to fixed placements, treasury bills, commercial papers, and structured notes.

3. Product Principles

- **One engine, many storefronts.** Every product is a placement record with a rate, tenor, and rules. Tabs and channels (app, web, WhatsApp) are views over one backend.
- **Transparency is the differentiator.** Every product shows its rate, tenor, and minimum together, in plain English, with the instrument or backing described. Rate is never shown without minimum.
- **Self-service by design.** Every question a user could ask ("did my money arrive?", "when do I get paid?", "why did this fail?") must be answerable by a screen, not a support agent.
- **Calm, institutional feel.** Navy and gold, private-banking tone. No gamified noise, no public social feeds. Money is private.
- **Nothing hard-coded that operations should control.** Rates, products, referral values, thresholds, feed content: all set from the admin console without developer involvement.
- **Speed is trust.** Balance visible within one second of opening. Deposits confirmed within seconds. Instant feedback on every action.

4. Scope Summary

Deliverable	Description
Mobile app (Android + iOS)	Full consumer application as specified in Sections 5-12. Primary channel.
Web application	Feature parity with the mobile app for consumers, responsive, same backend.
WhatsApp channel	Full rollout at launch: sign-up, KYC, funding, investing, balances, withdrawals (Section 11).
Admin console	admin.mykipit.com - separate web console with role-based access (Section 12).
Backend and APIs	Single backend serving all channels. Double-entry ledger. Documented REST APIs.
Transactional email service	All emails in Section 10.6, plus scheduled digests.
Data migration	Existing users, balances, and KYC records migrated (Section 16).

Named future phases (documented in Section 17, priced separately or excluded): borrowing against investments, in-app corporate accounts, halal/non-interest products, joint goals, dollar assets, equities, and trading-style products. The core ledger must nonetheless be built collateral-ready from day one (Section 14).

5. Application Structure - Five Tabs

The consumer application has five bottom-navigation tabs: **Home** · **Invest** · **Explore** · **Portfolio** · **Settings**.

5.1 Home

- Total portfolio value at the top with a "+N earned this week" line and a hide-balance (eye) toggle. Balance must render within one second of app open.
- Wallet balance card and next-maturity card.
- Upgrade nudge: contextual card comparing idle money against what it would earn if placed (e.g. "N500,000 in your wallet is earning N0. Move it to Call or a 90-day plan -> earn N X"). Copy driven by real balances and current rates.
- Quick actions: Add Money, Withdraw, New Plan, Statements.
- Feed: a scrollable stream of cards managed by the Marketing Admin - new product announcements (deep-link directly to the product page), education and blog posts (open in-app), social media links (open externally), and service announcements. Every card is tappable.
- Push notifications are sent for new products and maturities only; feed-only content (blogs, socials) must not push.

5.2 Invest (direct products)

- **Call Account:** fully liquid, deposit and withdraw anytime, earns interest accrued and credited daily, visible daily. Minimum N1,000 (admin-configurable).
- **Fixed Plans:** preset tenors (1, 3, 6, 12 months) plus **Custom tenor** - the user selects any number of days; the rate is quoted live from the admin-set rate curve (Section 12.6) and the calculator shows exact interest and total payout before confirmation.
- Plans are locked until maturity. There is no early-withdrawal or emergency-break facility anywhere in the product.
- Top-up of an existing plan: additional money joins at the current rate for the remaining tenor.

- Auto-invest: at plan creation the user may enable a recurring debit (tokenised card, e.g. "every 25th, N50,000 into this plan").
- Plan naming and goals: user names the plan ("School Fees 2026"), optional target amount with progress bar.
- Gift toggle at plan creation (Section 9.3).
- Maturity instruction selected at creation: roll over, move to wallet, or pay out; changeable anytime; re-confirmed 7 days before maturity.

Licensed Partner disclaimer - the only place it appears in the interface: a short line at the bottom of the Invest tab, e.g. "Kipit does not manage funds. All funds are managed by our SEC-licensed partner." Exact legal copy to be supplied by Kipit before build completion.

5.3 Explore (the investment supermarket)

Explore is a category-first shelf. Aisles at launch: **Treasury Bills · Commercial Papers · Private & Structured Notes · Commodities (marked "Coming soon") · Managed Portfolio · International & Alternatives (future teaser)**. Aisles, products, rates, minimums, and open/closed status are all controlled from the admin console; adding a product must never require code changes.

- Every product card shows: rate, tenor, and minimum together (never rate alone), issuer or backing, a regulator line, a plain-English description page, a calculator, and a subscribe action.
- Products are one-directional subscriptions held to maturity. There is no secondary trading, no sell function, and nothing that resembles an exchange.
- "Notify me" capture on coming-soon aisles; rate alerts ("tell me when a product above X% opens").
- Large-ticket direct instruments (N5m+) are listed with a "Request access" action that routes to a wealth adviser and is fulfilled offline; the app does not automate direct settlement at launch.
- Where a user opens a product they cannot yet afford, the card cross-links to an affordable alternative in Invest ("Start smaller: plans from N10,000").

5.4 Portfolio

- Breakdown chart of holdings by category (wallet, call, plans, Explore products).
- Active holdings: each with a progress bar to maturity, days elapsed/remaining, accrued interest to date, expected payout, and its documents.
- **Investment History:** every matured or completed holding retained permanently - amount, tenor, rate, interest earned, dates, documents, receipts.
- Maturity calendar: a calendar view of every future payday.
- Transaction history: one stream of everything - deposits, withdrawals, investments, interest credits - each entry opening a receipt (reference number, timestamps, status).
- Statements: self-generated on demand by type and date range, delivered in-app and to email.
- Kipit Reports: monthly, quarterly, and annual summaries (total earned, average rate, comparison benchmarks), downloadable and shareable. Sharing exists here and on badges only.
- Gifts section: gifts sent, pending claim, claimable/cancellable.

5.5 Settings

- **Profile:** First name, Middle name (optional), Surname, Date of birth, Gender, Email, Phone, Address (street and house number, city, state, LGA), Occupation, Employment status, Source of funds. Name, date of birth, and gender lock permanently once BVN/NIN verification passes. Address remains editable, but any edit triggers address re-verification: the user uploads a utility bill and the address shows "pending verification" until Compliance approves.
- **Payout banks:** add/manage payout accounts; every account must pass NIBSS name-match against the verified BVN name before it can be used.
- **Security:** change password; change/reset the 4-digit transaction PIN; biometrics toggles (fingerprint / Face ID for login and for transaction approval); active sessions list with remote log-out.
- **Linked cards:** tokenised card management (Section 10.3).
- **Referrals:** personal referral code, shareable link, count of people referred, and rewards earned.
- **Notification preferences:** granular email toggles - deposits, withdrawals, investments, maturities, daily interest digest - plus push preferences.
- Help centre / FAQ, then chat and WhatsApp support as the last resort. Legal and policy documents with the version and timestamp the user accepted.

6. Product and Money Logic

6.1 The wallet earns nothing

The wallet is a funding and settlement balance only. **Money in the wallet earns no interest.** To earn, money must move into the Call Account or into a plan or Explore product. Maturity proceeds land in the wallet (where they earn nothing), which is deliberate: the product design and nudges push idle wallet money into Call or placements. All copy must reflect this honestly ("your wallet balance is earning N0").

6.2 Interest display

- Call interest accrues and is credited daily, visibly ("+N412 today").
- Plans show interest accrued to date, daily interest, and expected payout at maturity.
- **Interest projection everywhere:** every balance shows its future value ("at this rate: N X by [date]"), and every product page carries a calculator. Future value is quoted wherever a balance appears.

6.3 Automatic maturity engine

- At 00:00 on maturity date the engine runs without human action: principal plus interest is credited to the wallet, the holding moves from Active to Investment History, and the user receives an email ("Your plan matured. N X is in your wallet. Roll it into a new plan at Y% ->" - one-tap rollover).
- If the user pre-set a rollover instruction, it executes automatically and the email confirms what happened.
- Operations sees a daily "maturities processed" report confirming the engine ran cleanly.

6.4 Rate curve

All Invest rates derive from a single admin-managed rate table of tenor bands (illustrative: Call · 1-90 days · 91-120 days · 121-180 days · 181-364 days · 365+ days), each with a per-annum rate. Custom tenors price from their band automatically. Rates apply to new placements from their effective date only - never retroactively to running placements. Launch rates will be supplied by Kipit before go-live; the table

structure and edit flow are specified in Section 12.6.

7. Onboarding, Identity and KYC

7.1 Sign-up (under one minute)

- Sign up with Google, Apple (required on iOS when Google sign-in is offered), or phone number.
- The user types their real First name, Middle name (optional), and Surname at registration - the display identity and the basis for BVN matching. Email handles alone (e.g. "sexydiva956") are never treated as a name.
- Optional referral code field at sign-up. It never blocks progress.
- The user is inside the app, browsing everything, in under sixty seconds. No document requests at the door.

7.2 Tiered KYC - gates at the money, not the door

Tier	Requirements	What it unlocks
Tier 0	Sign-up only	Browse all products, rates, calculators. No money in.
Tier 1	Phone verified (OTP) + BVN verified; name matched and locked	Fund the wallet, invest in Call and plans.
Tier 2	NIN + liveness selfie + address + occupation, employment status, source of funds	Withdrawals, adding payout banks, unrestricted limits. Money never exits below Tier 2.

Each tier is presented as a checklist with a progress indicator, and the app prompts completion only at the moment of need ("to withdraw, complete verification - about 2 minutes").

7.3 Name and BVN matching

- On BVN verification, the system compares the typed name against the BVN-registered name using **fuzzy matching** - name order, missing middle names, and minor spelling variations must not fail the match ("Lotanna C. Ikeokwu" vs "IKEOKWU LOTANNA CHUKWUEMEKA" is the same person).
- Strong match: auto-pass; the BVN version becomes the locked legal name.
- Partial match: the app shows "Your BVN returned: [name]. Is this you?" for the user to confirm.
- Genuine mismatch: routed to the Compliance Admin queue for human review - never a dead end.
- The payout protection is the name-match rule: withdrawals can only ever go to bank accounts that NIBSS name-match the verified BVN name.

8. User Authentication and Security

- **Password** is the account credential (with OTP-verified reset).
- **Transaction PIN**: a 4-digit PIN, set at onboarding, distinct from the password. Used together with biometrics for quick login, and **required to authorise every money movement**: placements, withdrawals, plan changes, card actions. Sequential (1234) and repeated (1111) PINs are rejected.

- **Biometrics:** fingerprint / Face ID toggles for (a) quick login and (b) transaction approval in place of typing the PIN.
- On the WhatsApp channel the PIN is **never typed into the chat**: every transaction opens a secure WhatsApp Flow popup for PIN entry.
- Device and session management: active sessions listed in Settings, remote log-out, and a new-device email alert.
- PIN/password reset can be triggered by an admin (Section 12.4) but is always completed by the user on their own device; no admin can see or set a credential.
- All PII and credentials encrypted in transit and at rest; NDPA-compliant handling throughout (Section 14).

9. Growth and Retention Features

9.1 Referrals

- Referral code field at sign-up; every user gets a personal code and shareable link in Settings, with a visible count of people referred and rewards earned.
- Rewards pay on the referred user's **first investment**, not on sign-up, to both sides. Values and rules are set by the Marketing Admin; attribution and payment are automatic.

9.2 Badges and shareable milestones

- Badges: First Deposit, First Investment, First Maturity, Crossed N1 Million (congratulations moment), and further milestones. Each badge is a well-designed shareable card the user can post to WhatsApp status and socials with a built-in share action.
- Sharing is always user-initiated. There is no public feed, leaderboard, or visibility of any user's activity to other users.

9.3 Plan gifting

- Created in Invest via a "This is a gift" toggle on plan creation; the sender funds it and shares a claim link.
- The recipient signs up (a referral with money already inside), claims, and the plan appears in their Portfolio with a "Gifted by [name]" tag.
- Unclaimed gifts sit in the sender's Portfolio > Gifts, trackable and cancellable.

9.4 Habit loops

- Daily visible Call interest and the daily digest email (Section 10.6).
- Maturity autopilot and a rate-lock offer at rollover ("roll over now and keep 19% even if rates drop").
- Salary-day intelligence on auto-invest ("tomorrow is the 25th - keep your auto-invest at N50,000 or raise it?").
- Home-screen widget (portfolio value), balance within one second via biometric open, dark mode, data-light mode, and offline last-known balance with timestamp.

10. Payments and Money Flow

10.1 Deposits - user's choice of rail

- **Monnify:** a dedicated virtual account in the user's name (name-matched), displayed with bank, account name, and number plus copy action. Transfers reflect in the wallet within seconds, confirmed by push and email.
- **Paystack:** checkout flow supporting card, transfer, and USSD.
- The user chooses either rail at every funding moment. Both credit the wallet.
- A "My transfer hasn't arrived" self-report lets the user submit their transfer reference without contacting support.

10.2 Paying for an investment

- At every investment checkout the user chooses the funding source:
- **Fund from Wallet** - shown with available balance; **greyed out and unselectable if the balance is insufficient**, with the shortfall displayed.
- **Pay via Paystack** - opens the Paystack payment page and settles the investment directly on success.

10.3 Cards

Cards are linked and stored as **processor tokens only** (Paystack); the platform never stores card numbers. Tokens power instant top-ups and auto-invest debits.

10.4 Withdrawals - manual processing at launch

- Withdrawals are available only at Tier 2 and only to NIBSS name-matched payout accounts. A KYC-incomplete user cannot submit a withdrawal at all.
- On submission the request enters status **Processing** (the default) and automatic emails go to four admin roles: Operations, Compliance, Global, and Super Admin.
- Operations opens the **Withdrawal Requests** section of the console: the request shows the user, amount, and destination bank, with one-click access to the user's full profile, wallet, holdings, KYC status, and history.
- After review, Operations debits the user's wallet from the request screen. The actual bank payment is instructed **off-platform**: an email to the Managing Director requesting release of the payment. The console does not move bank money at launch.
- When the bank payment is confirmed, Operations toggles the request to **Successful**; if refused, to **Declined** with a reason (wallet re-credited automatically). The status change fires the user's email in either case.
- Withdrawal statuses are exactly three: **Processing (default)** · **Successful** · **Declined**. The user sees a live tracker of this status in the app.
- The architecture must allow a later switch to automated payouts (e.g. Paystack Transfers below an admin-set threshold) without redesign; this automation is Phase 2 and not in the launch build.

10.5 Reconciliation

A daily reconciliation view in the console matches Monnify inflows, Paystack collections, and ledger entries to the kobo, with variance alerts. This is a launch requirement, not an option.

10.6 Transactional and digest emails

- Deposit received · withdrawal Processing/Successful/Declined · plan created · plan topped up · plan matured (with one-tap rollover) · plan adjusted by admin · KYC approved/rejected · new device login.
- **Daily portfolio digest** (toggleable): "You earned N1,000 today. Expected interest on [plan]: N220,000; earned so far: N X. Your portfolio is now N1,001,000 - keep going." Content assembled per user from live data; send time scheduled by Marketing Admin.

11. WhatsApp Channel - Full Rollout at Launch

The WhatsApp channel is a first-class doorway into the same backend, built on the Meta WhatsApp Cloud API with WhatsApp Flows for structured input. It launches with the app, at full capability:

- Sign up on WhatsApp (name capture, OTP, PIN setup via secure Flow).
- Complete KYC via Flows (BVN, NIN, liveness/media upload, address).
- Fund the wallet (virtual account display, credit confirmations).
- Create plans and subscribe to Explore products (same rates, limits, and tiers as the app).
- View balances, portfolio, and maturities; receive maturity and credit alerts as templates; statements delivered to email.
- Withdraw (Tier 2 only), entering the same manual withdrawal pipeline as the app.
- **Every transaction is authorised by the 4-digit transaction PIN entered in a secure Flow popup - never typed into the chat thread.**
- Architecture: a stateless bot service (webhook receiver, session state machine, intent routing) with a session store (e.g. Redis with TTLs), speaking only to the same authenticated core APIs as the app. The bot never touches money or PII except through those APIs. All money endpoints idempotent - zero duplicate debits.

12. Administration Console - admin.mykipit.com

A separate web console, unreachable from the consumer surfaces. Admin login: password plus 2FA once per day per device, then a 4-digit quick re-entry PIN for the rest of the day. Every session and action is recorded (Section 12.8).

12.1 Roles

Role	Powers
Super Admin	Absolutely everything, including the ONLY power to create, suspend, edit, and delete admin accounts and permissions. Final approver on sensitive maker-checker actions.
Global Admin	Everything every other admin role can do - full visibility and all operational powers - EXCEPT managing admin accounts.
Compliance Admin	KYC queue: each pending user with BVN result, NIN, liveness selfie, address document; approve, reject with a reason (shown to the user in-app), or escalate. Address re-verification queue. Freeze/unfreeze users. AML flags and regulatory report exports.
Operations Admin	Global transactions view; executive dashboard and maturity tracker (12.5); withdrawal requests queue (10.4); user plan adjustments (maker-checker); daily reconciliation; maturities-processed report.

Role	Powers
Marketing Admin	Rate table management (12.6); referral bonus values and rules; push and email campaigns; Home feed, banners, and education posts; daily digest scheduling.

12.2 Global transactions view

- Every deposit, placement, interest credit, and withdrawal across all users in one screen; filters by day, month, custom date range, product, status, channel, and user; headline totals (total invested, total interest paid) sortable per user and per period; full export for reporting.
- Click-through on any user opens their complete profile: balances, holdings, transaction history, KYC record, sessions, and support tickets.

12.3 User and product management

- Back-office user creation (Global Admin): create a profile for a user onboarded by phone/adviser; the user claims it by verifying email/phone and setting their own password and PIN.
- Credential assistance: trigger password or PIN resets and edit profile details (with mandatory reason, logged). Admins never see or set credentials.
- Product management: create, price, open, and close products in any Explore aisle; edit descriptions, minimums, and documents. No code changes ever required to stock the shelf.
- User plan adjustments (Global Admin and Operations): any change to a live placement is maker-checker (one admin proposes, a different admin approves), reason mandatory, user auto-emailed, before/after values recorded immutably.

12.4 Withdrawal requests

As specified in Section 10.4: request list with statuses Processing / Successful / Declined, review panel with full user context, wallet debit action, and status toggles that fire user emails. Compliance sees the same queue read-only with freeze powers.

12.5 Executive dashboard and maturity tracker

Visible to Operations, Global, and Super Admin. This is the business cockpit:

- **Total funds under management** = the sum of all invested principals plus all wallet balances.
- **FUM breakdown**: wallet balances · Call principal · principal per tenor band (e.g. 30-day, 90-day, custom) · principal per Explore product (CPs, T-bills, notes, managed).
- **Liability view**: weighted average rate payable, total interest accrued and owed, interest falling due this week / this month.
- **Maturity tracker**: total amount maturing this week, this month, and in any custom date range - with a per-user breakdown of who owns each maturing amount, so cash can be readied.
- **Liquidity assumption**: wallet balances and Call money are counted as liquid now (withdrawable at any time) in every maturity and liquidity view; only tenor-locked placements sit at their maturity dates.

12.6 Rate table (Marketing Admin)

- A single rate table of tenor bands - Call · 1-90 days · 91-120 days · and subsequent bands - each with a per-annum rate. Marketing Admin selects a band and types the new rate.

- Every rate change is maker-checker approved and effective-dated; it applies to new placements only, never retroactively.
- The same screen manages the referral reward values.

12.7 Support and communications

- Support tickets attach to user profiles so any admin sees full history.
- Campaign tools (Marketing Admin): compose and send push and email campaigns to all users or filtered segments; manage the Home feed cards with deep links.

12.8 Immutable audit log

Records every admin login (who, when, from where, on what device) and every action (what changed, old value to new value, by whom, when), searchable and exportable. Nobody - including the Super Admin - can edit or delete audit entries.

13. Design Direction

- **Brand:** deep navy primary with gold accent, taken from the Kipit wordmark (navy lettering, gold dot). Money figures highlighted in gold feel deliberate. Calm, private-banking aesthetic; flat, uncluttered, generous whitespace.
- **Typography:** Kipit does not prescribe a font. Reference screenshots supplied with this paper show the intended **style:** a bold, chunky, rounded, modern sans-serif with heavy weights on headings and large numbers, paired with a clean lighter text face. The designer selects the actual typefaces and sizes within that style.
- **Fixed by Kipit (non-negotiable):** the five-tab structure, the products and flows in this paper, the transparency rules (rate + tenor + minimum always together), hide-balance option, one-second balance render, instant transaction feedback, naira formatting with thousands separators.
- **Open to the designer:** layout, iconography, illustration, motion, component styling, and everything visual not fixed above.
- **Design gate:** the vendor presents at least two distinct design concepts, then wireframes and a clickable prototype of the core journeys (onboarding -> first deposit -> first plan; Explore subscribe; withdrawal) for Kipit's written approval BEFORE production code is written. Onboarding to first deposit must be achievable in under five minutes; plan creation in about three taps.

14. Non-Functional Requirements

- **Ledger:** double-entry ledger as the single source of truth for all money. Every money endpoint idempotent. Plan records collateral-ready (a placement can be marked as pledged) from day one, for the future lending phase.
- **Reliability:** 99.9% monthly availability target for consumer surfaces; graceful degradation and clear error states; offline last-known balance.
- **Performance:** balance visible within 1 second of open on a mid-range Android device on 3G; all money actions acknowledge within 2 seconds.
- **Security:** encryption in transit (TLS 1.2+) and at rest; OWASP MASVS/ASVS alignment; independent penetration test before launch (report delivered to Kipit); no card data stored (processor tokens only);

admin console isolated with 2FA.

- **Data protection:** Nigeria Data Protection Act (NDPA) compliant handling of NIN, BVN, and personal data; data residency and processor agreements documented.
- **Consent records:** versioned Terms, Privacy Policy, Risk Disclosure, and per-product Placement Terms; acceptance captured with timestamp and version at registration and at every subscription.
- **Backups and disaster recovery:** automated daily backups stored separately from production, restore-tested quarterly, with a written recovery time objective. Deliverable, not optional.
- **Observability:** monitoring, alerting, and structured logs; a daily automated job report (maturity engine, digests, reconciliation) visible in the console.

15. Engagement Terms, Ownership and Handover

- **Ownership from day one:** all source code in Kipit-owned repositories; all infrastructure in Kipit-owned cloud accounts (vendor invited as collaborator); domains, Google Play, and Apple developer accounts in Kipit's name; full IP assignment executed at contract signing.
- **Payments by milestone** against the acceptance criteria in Section 18 - no large upfront deposits.
- **Design gate** per Section 13 before production code.
- **Documentation and handover are paid deliverables:** architecture documentation, API reference, runbooks, and a structured handover to Kipit's in-house engineers. Kipit's senior engineer joins the vendor's code reviews before build completion.
- **Warranty and support:** a defect-fix warranty period post-launch and an optional support retainer, quoted separately.
- The vendor must disclose all third-party components and licences used.

16. Data Migration

- Existing platform users (fewer than 200), their balances, KYC records, and transaction history are migrated into the new platform.
- The vendor delivers a migration plan: extraction, transformation, validation against the new ledger to the kobo, a dry run, and a cut-over plan with rollback.
- Migrated users are prompted on first login to set a new password and transaction PIN and to confirm their details; KYC statuses carry over where verifiable.

17. Named Future Phases - Not in the Launch Build

Future feature	Note for architecture today
Borrow against investments	Ledger and plan records collateral-ready from day one (14).
Automated payouts below a threshold (e.g. Paystack Transfers)	Withdrawal pipeline designed so automation slots in without redesign (10.4).
In-app corporate accounts (multi-signatory, corporate KYC)	Handled offline by advisers at launch.

Future feature	Note for architecture today
Halal / non-interest products	Named as a market consideration; product engine must support fee-based (non-interest) product types later.
Joint/family goals; dollar assets; equities; trading-style products	Excluded from launch by design.
Fraud automation (velocity rules, cooling periods) and account-closure workflows	Handled manually by Compliance at launch; not built.

18. Acceptance Criteria (Summary)

Each milestone is accepted only when its criteria pass in a staging environment mirroring production. Headline criteria - the vendor's plan must expand these into a full test plan:

- A new user signs up (Google/Apple/phone), reaches Tier 1, funds the wallet by Monnify transfer, and the credit reflects with push + email in under 60 seconds end-to-end.
- A plan created with a custom tenor prices correctly from the rate table; the calculator, accrual, and maturity payout reconcile to the kobo.
- The maturity engine processes a matured plan at 00:00 unattended: wallet credited, history updated, email sent; pre-set rollover executes correctly.
- Insufficient wallet at checkout: "Fund from Wallet" is greyed out with shortfall shown; Paystack checkout completes the same investment successfully.
- A Tier 1 user cannot submit a withdrawal; a Tier 2 user's withdrawal enters Processing, emails all four admin roles, and Operations can complete the full review-debit-toggle flow; the user's tracker and emails update on Successful and on Declined (with wallet re-credit).
- WhatsApp: a brand-new user completes sign-up, KYC, funding, an investment, and a withdrawal request entirely on WhatsApp, with PIN entry only ever via secure Flow popup.
- Every rate change, plan adjustment, and admin action appears in the immutable audit log with old/new values; a plan adjustment is impossible without a second approver.
- Reconciliation matches Monnify, Paystack, and the ledger to the kobo on a day of mixed test traffic.
- Migration dry run reproduces every legacy user balance to the kobo.
- Penetration test findings at severity high or above: zero open at launch.

19. Commercial Response Requested

The vendor is asked to respond with: (1) confirmation of scope understanding and any written clarification questions; (2) a milestone plan with timeline; (3) a fixed price per milestone, separately itemising the mobile apps, web app, WhatsApp channel, admin console, migration, and the post-launch warranty/support retainer; (4) the named team and the portfolio of the specific UI/UX designer who will work on Kipit; and (5) confirmation of acceptance of the ownership and handover terms in Section 15.

This document, its structure, and the product concepts described are the confidential property of Kipit Technologies Limited.
